

V1

- Electronics, Sensors, Actuators
 - Camera for Piece Identification
 - Have a sensor for depending on which side of the board the robot is in contact with, it indicates whether B or W
 - Motors with encoders for position determinations for robot arm
 - Actuator for gripper
 - Physical Screen and Switch for setting Stock Fish API ELO
 - LEDS for marking players turn and player success
 - STM32/Arduino/Raspberry Pi for brain
- Physical Components
 - Gripper
 - Linkages
 - Motor Mounts
 - Gears
 - Rack and Pinion for Gripper
 - Chess Board
 - Chess Pieces
 - Low power Screen
 - Buttons
 - Power Supply for everything
 - Weak magnet inserts, 64 total, under each piece and each square to hold piece position.
 - [Neodymium Mini Disc Magnets](#) - 0.07 lb pull force
 - 1/16" diameter 1/32" thick

V2

- Replace physical button marking end of turn for opponent with computer vision system recognizing when hands let go of piece, for "touch piece" gameplay
- Change gripper to resemble a human hand
- Allow for gestures controls for human computer interaction for when chess bot wins or loses
- Add a speaker to indicate check, checkmate, or stalemate, and first move player turn

V3

- Make it so that the ChessBot can also be put into remote paired play
 - Remote play will be that basically a user will be able to play another user anywhere in the world with wifi connection through the chessbot
